Information on gas, oil, and dual-fuel burners

WM 10 for gas, oil, and dual-fuel

WM 10 monarch® burners (55–1250 kW) • versatile performance

Progress and tradition: The latest monarch® burner

The monarch® trademark has stood for power and quality for more than 60 years

For more than six decades, Weishaupt's monarch® series burners have been used on a wide variety of heat generators and industrial plant, and their success has helped underpin Weishaupt's outstanding reputation.

The latest monarch® series is writing the next chapter in this success story. The combination of state-of-the-art equipment and a compact design makes these powerful burners suitable for a wide range of applications.

Digital.

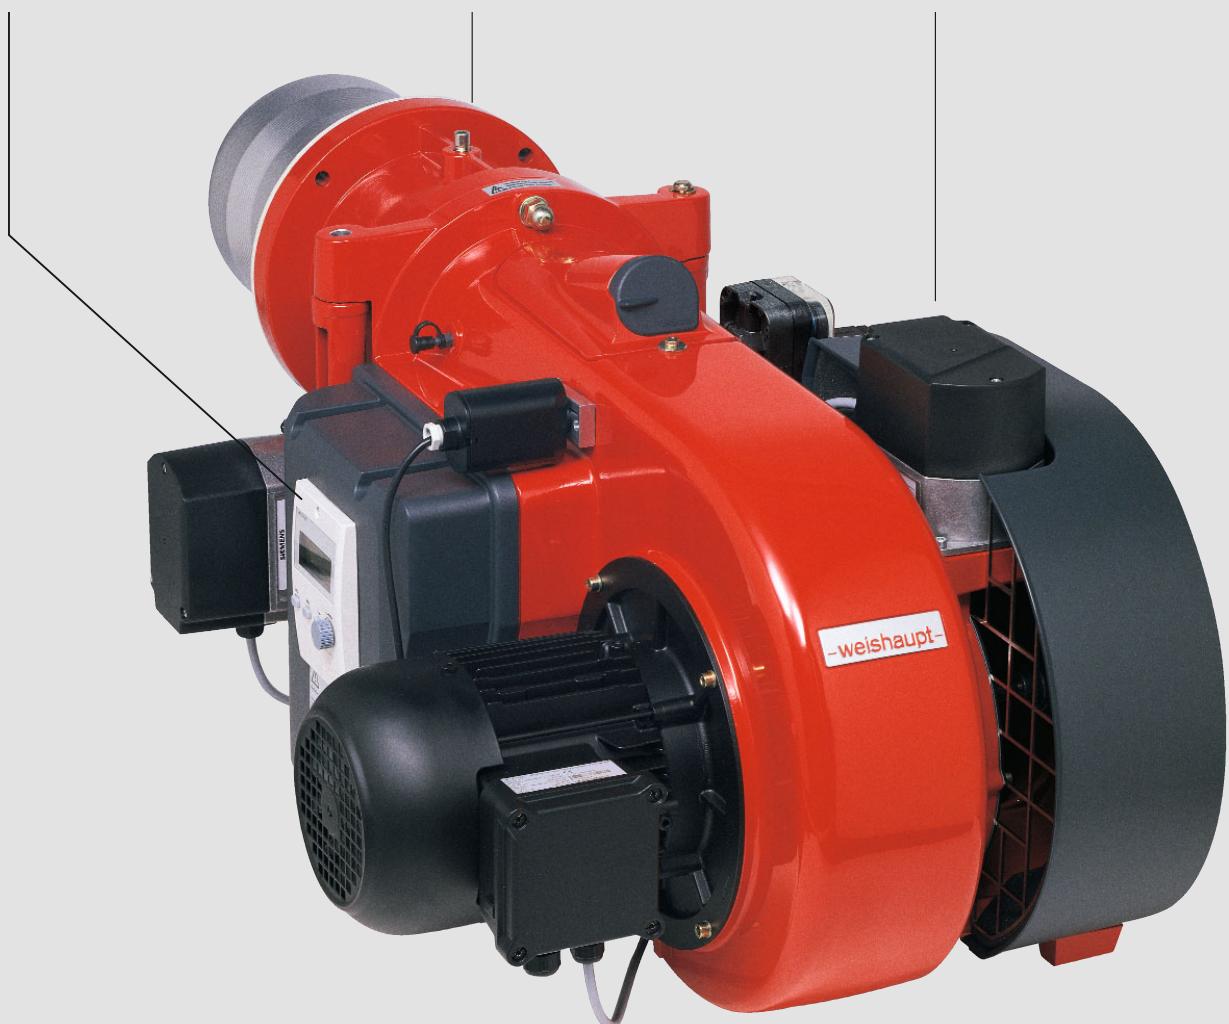

Digital combustion management enables economical and reliable burner operation. The equipment is simple to use.

Compact.

The aerodynamic housing and special air feed enable a higher capacity within smaller overall dimensions.

Quiet.

WM 10 monarch burners operate with considerably reduced noise levels, thanks to their specially developed fan unit.

WM 10 monarch® burners

The right version for every application

The latest WM-series burners from Weishaupt are compact, powerful, and quiet. They are writing the next chapter in the 65-year-long success story of the legendary monarch® series.

Futuristic fan technology

From the very earliest stages of burner development, particular emphasis was placed on a compact, aerodynamic design and low operational noise levels.

A completely new air inlet and air damper control were developed to realise this goal. The special housing design with its self-opening air inlet and the new air-damper technology result in an increase in fan pressure and thus in greater capacity despite the burner's more compact form.

Air damper control provides a high degree of linearity even at the lower end of the burner's operating range and, combined with the sound-attenuated air inlet which is included as standard, ensures quieter operation.

Fast commissioning, simple servicing

All WM 10 burners are delivered with the mixing assembly preset for the required output of the burner, provided the relevant heat generator data are known. A final adjustment is made using the combustion manager's menu-controlled commissioning program.

All of the components, such as the mixing assembly, air damper, and combustion manager, are readily accessible despite the burner's compact form. This enables maintenance and servicing work to be carried out quickly and easily, aided by the standard hinged flange which provides a perfect servicing position.

Adjustments to suit different combustion chamber conditions can easily be made with the burner in its installed position. The integral sightglass provides a view of the flame.

Various burner versions are available, which meet differing operational requirements and emission limits:

ZM version

Burners with Weishaupt's standard, advanced design of mixing assembly for installations with Class 2 gas and oil-side NO_x emission limits.

LN version

Low-NO_x gas burners that provide a further improvement in NO_x emissions (to Class 3) compared to the standard mixing assembly. The reduction in NO_x is achieved through a more intensive recirculation of combustion gases in the combustion chamber.

Good emissions depend on combustion chamber geometry, thermal loading and on the combustion system (three-pass or reverse-flame).

ZMI version

Gas burners with an extended turndown range for special industrial applications.

3LN version

Low-NO_x gas, oil, and dual-fuel burners with multiflam® mixing assemblies that generate emissions below Class 3 NO_x limits for both gas and oil. The burners' very low NO_x emissions are achieved using a special fuel distribution system. 3LN-version burners can fire natural gas, LPG, or light oil, and are suitable for use on three-pass and through-pass boilers.

The most important advantages:

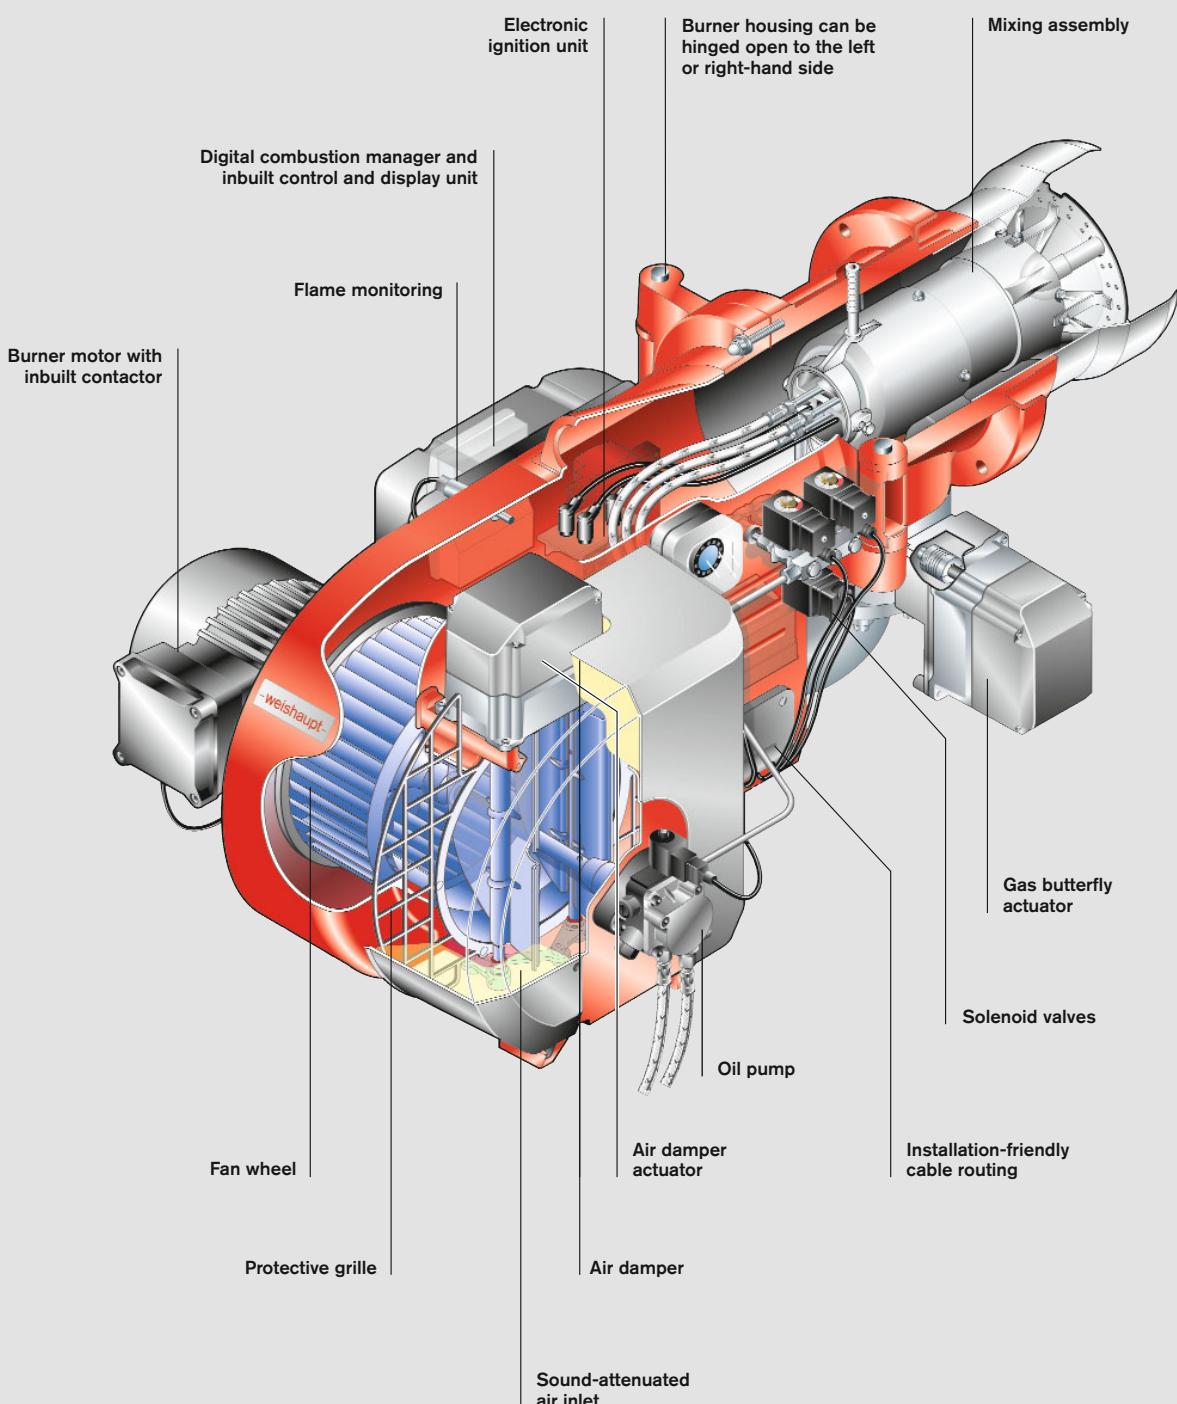

- Digital combustion management with electronic compound regulation.
- Compact design.
- Easy access to all components.
- Sound-attenuated air inlet as standard for quieter operation.
- IP 54 protection.
- Suitable for a wide range of gas types, such as natural gas, LPG, town gas, coke oven gas*, biogas*, or sewage gas* (*gas analysis required).
- Different mixing assemblies depending on emission limits.
- Suitable for operation with intermittent or continuous firing.
- Load control can be effected by means of thermostats, pressure controls, or current/voltage signals.
- Sliding-two-stage or modulating load control when firing on gas.
- Two-stage, three-stage, or sliding-two-stage / modulating load control when firing on oil, depending on the burner version and method of control.
- Where data are known, all WM-series burners are supplied with their mixing assembly preset for the required firing rate. WM-L burners are also supplied with ready-fitted oil nozzles.
- Electromagnetic clutch to disconnect the oil pump (optional extra on some models).
- Computer-controlled function test of each individual burner at the factory.
- Well-established, global service network.

Optional equipment:

- Variable speed drive for burners with modulating load control.
- Integral KS 20 load controller (in conjunction with W-FM50 / 54).
- Ducted air inlet.

Trademark protection

Weishaupt WM 10 monarch® burners are registered as a Community Trade Mark throughout Europe.

That's flexibility: Numerous options to choose from

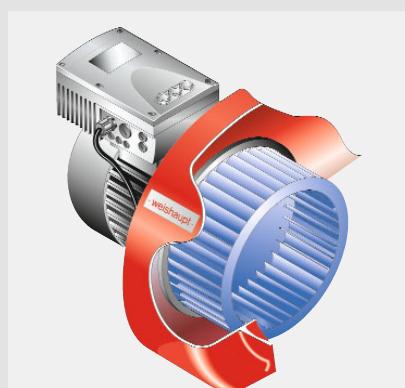

7-pole and 4-pole plugged connections

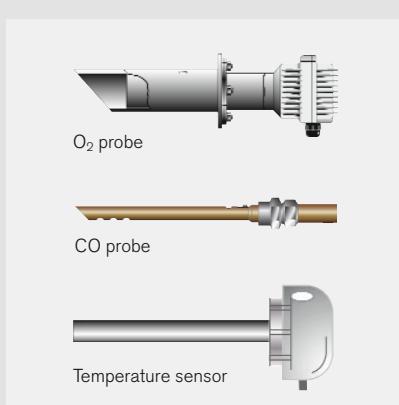

Integral KS20 load controller

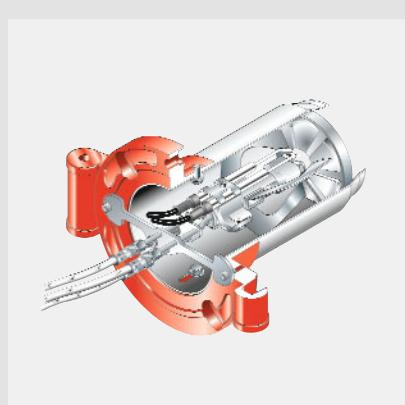

Expanded motor terminal box with contactor and electronic overload protection

Integral frequency converter for VSD

Monitoring and control of flue gases for O₂, CO, and temperature

Combustion head extensions to suit different boiler doors and insulation

With the right selection of optional equipment, the best products can be made even better.

The familiar 7-pole and 4-pole plugs used on W-series burners can also be fitted to WM 10 burners, and many heat generators are equipped with the appropriate mating connectors. These optional plugs not only simplify the final connection of the control voltage, but also make it easy to electrically isolate the burners during servicing work.

Modulating burners need a load controller in order to modulate, and Weishaupt can fit one into the burner controls cover. The unit is pre-configured at the factory and supplied fitted and wired. An automatic adaption of the control parameters adjusts the controller to system characteristics.

The burner motor's large electrical junction box incorporates both a contactor and an overcurrent trip to protect the motor.

Optional efficiency, emissions, and safety optimisations are available for all industrial burners. Variable speed drive (VSD) offers a considerable reduction in energy costs and noise emissions when the burner is firing at partial load. O₂ trim and CO control increase both the safety and the efficiency of the plant. A flue gas temperature sensor indicates a limit value has been exceeded, which points to fouling of the heat generator.

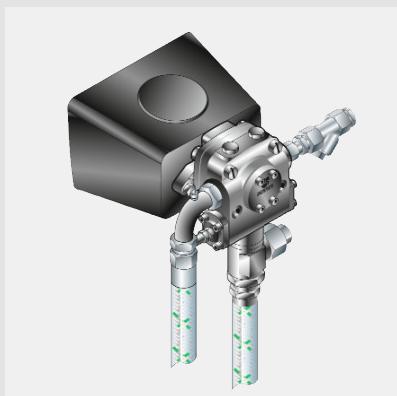

Combustion head length is determined by the mounting depth of the heat generator, the design of the appliance, and the nature of the application. Standardised 100, 200, and 300 mm head extensions meet the requirements for virtually every project. Of course, longer extensions are available on request where necessary.

A continuously running fan stops high temperatures radiating back through the burner after firing has ended. During this phase, an electromagnetic clutch allows the oil pump to be disconnected from its drive. This has the benefit both of keeping the pump cool and reducing its wear. The burner motor's power consumption is also lower during the continuous fan phase.

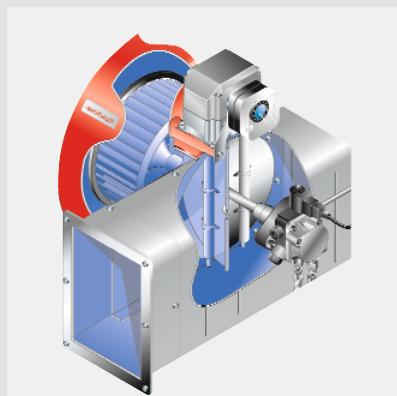

In many installations, a supply of clean combustion air that is free of impurities cannot always be guaranteed. To overcome this, Weishaupt offers special air inlet housings for the WM 10 that enable the connection of a ducted air supply. The housings enable the ducted air supply to be connected to the burner from above, below, or the rear. By connecting an air duct, it is possible to draw combustion air from a "clean", temperate area. The air inlet system includes an additional air pressure switch as standard, which guards against low pressure and thus ensures an adequate supply of air to the burner.

The CAN bus system used by the W-FM 100 and W-FM 200 combustion managers means they can be mounted either on the burner or in a control panel. As a result, the installation is optimally matched to the ambient conditions on site.

Weishaupt sound-absorbing shrouds can reduce noise emissions by up to 25 dB(A), depending on the version employed. The typical 72 dB(A) sound pressure level of a WM-G10/1-A ZM-LN burner, for example, can be reduced to 47 dB(A) through the use of a sound absorbing shroud.

Oil burners with continuously running fan have an electromagnetic clutch

Air inlet connection for a ducted supply of clean air
Example: WM-L 10

W-FM 100 or W-FM 200 combustion manager mounted in the burner

ACS 410/ACS 450 servicing software

W-FM 100 or W-FM 200 combustion manager mounted in a control panel

Sound-absorbing shroud

Digital combustion management: Efficient and reliable

Digital combustion management means optimal combustion figures, continuously reproducible setpoints, and ease of use.

Weishaupt WM 10-series burners are all fully equipped with digital combustion management and electronic compound regulation. Combustion technologies in the modern age demand a precise and continually reproducible dosing of fuel and combustion air. This enables optimal combustion efficiency and saves fuel.

Simple operation

Setting and control of the burner is achieved using a control and display unit. The unit for the W-FM50 and W-FM54 has a language-neutral display that presents all operationally relevant parameters in an easy-to-understand manner. The unit for the W-FM100 and W-FM200 is equipped with a clear-text display with a choice of

languages. Both systems enable the precise setting of the burner, and retain data that provide information on the operational mode of the burner. Additional memory in the control and display unit stores system settings so that they can be quickly copied across to a new combustion manager.

Servicing software

Full documentation is an essential part of commissioning and servicing. Among other things, the servicing software provides access to combustion manager settings, which can be changed, saved, and printed out. That saves both time and money.

The most important advantages

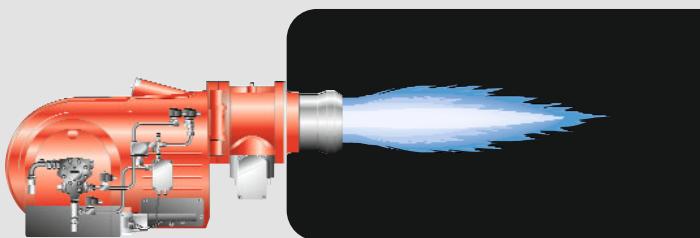

- Digital combustion management makes burner operation simple and reliable.
- No additional burner controls are necessary as control is effected by the combustion manager.
- Reduced installation expense: Each burner is factory tested and supplied as a complete unit.
- Commissioning and servicing takes less time. The burner's basic parameters are set at the factory. The combustion manager's menu-driven commissioning program is used to run through the final site-specific adjustments and the combustion emission checks.

Flexible communications: Compatible with building management systems

BMS connection options

Remote monitoring made easy via tablet or laptop

The digital combustion manager is the basis of communications with other superordinate systems. This is generally achieved using the eBus or Modbus protocols.

All the usual burner and boiler functions can be monitored and controlled through a direct connection with a building management system.

A graphical HMI is available as an option to provide a user-friendly overview of the boiler. The touchscreen display allows numerous functions to be adjusted and monitored, such as system parameters and setpoints of individual and multi-boiler plant and ancillary equipment.

The controls specialists, Neuberger, who are a part of the Weishaupt Group, are able to design and implement complex control solutions.

Further optional components enable connections to be made to systems using commonplace industrial standards, such as Profibus-DP, LON-Bus, and Modbus-RTU, and via network protocols such as Profinet I/O, Modbus-TCP, BacNet, etc.

A recent addition to Weishaupt's portfolio is the W-FM COM communications module. It transmits data securely over the internet so that it can be called up and displayed in a browser window on a computer, tablet, or smartphone, facilitating accurate service planning for example. Even away from the internet you can be kept up to date with the operation of the burner: In the event of a safety shutdown or other predefined trigger, an SMS text message is sent automatically.

Overview of burner control

Model designation

Gas and oil-fired operation

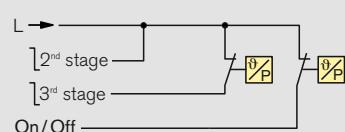

Two-stage control (Z)

- Two-term switching (e.g. temperature or pressure stat) causes actuators to drive the burner to partial load or full load in response to heat demand. Single-stage control with low-impact start can also be effected.

Two-stage

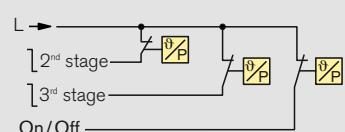

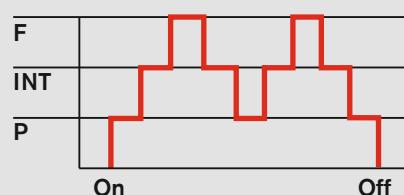

Control ¹⁾

Three-stage control (T)

- Two-term switching (e.g. temperature or pressure stat) for each load point causes actuators to drive the burner to partial load, intermediate load, or full load in response to heat demand. Two-stage control with low-impact start or changeover can also be effected.

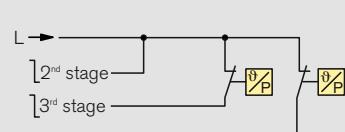

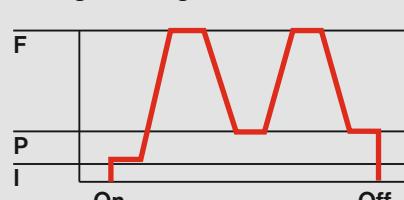

Three-stage

Sliding-two-stage control (ZM, R)

- Two-term switching (e.g. temperature or pressure stat) causes actuators to drive the burner to partial load or full load in response to heat demand. There is a gradual change between both load points. There are no sudden, large changes in fuel throughput.

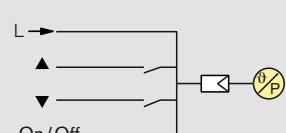

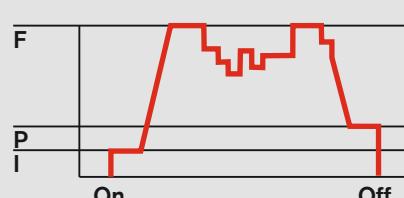

Sliding-two-stage

Modulating control (ZM, R)

- An electronic load controller causes actuators to make infinitely variable load adjustments in response to heat demand.
- Available modulation control options:
 - W-FM 100 with an optional integral load controller
 - W-FM200 with its standard integral load controller
- Alternatively, a PID controller can be fitted into the burner controls cover or into a control panel.

Modulating

F = Full load (nominal load)
 INT = Intermediate load
 P = Partial load (minimum load)
 I = Ignition load

¹⁾ Alternatively, staged control can also be effected by an electronic PID controller. In this case, appropriate temperature sensors or pressure transducers will be required.

The suitability of fuels of differing quality must be confirmed in advance with Weishaupt.

Applications

Weishaupt WM 10 burners are suitable for intermittent firing and continuous firing on:

- EN 303-compliant heat generators
- LTHW boilers
- HTHW boilers
- Steam boilers
- Air heaters
- Certain process applications

Permissible ambient conditions

- Ambient temperature
 - 15 to + 40 °C for gas firing
 - 10 to + 40 °C for oil firing
- Maximum 80 % relative humidity, no condensation
- The combustion air must be free of aggressive substances (halogens, chlorides, fluorides etc.) and impurities (dust, debris, vapours, etc.)
- Adequate ventilation is required for operation in enclosed spaces
- For plant in unheated areas, certain further measures may be required

Use of the burner for other applications or in ambient conditions not detailed above is not permitted without the prior written agreement of Max Weishaupt GmbH. Burner service intervals will be reduced to accord with the more extreme operational conditions.

The burners are labelled with

- CE Mark
- CE-PIN per 2009/142/EC

▪ Identification No. of the notified body

Gas supply

EN 88-compliant regulators with safety diaphragms are used for low-pressure supplies.

For high-pressure supplies, an EN 334-compliant high-pressure regulator should be selected from the following technical booklets:

- Regulators up to 4 bar, Print No. 83001202
- Regulators with safety devices, Print No. 83197902

Refer to the burner's rating plate for the maximum connection pressure.

Gas valve train design

Low-pressure valve trains are normally used for gas flow pressures up to a maximum of 300 mbar and a maximum operating pressure (MOP) of 500 mbar. This allows for pressure losses between the transfer station and the valve train. Furthermore, it is assumed that the transfer station utilises components (SSV, regulator) that are not of the highest class of accuracy. In individual cases, following consideration and approval by Weishaupt's headquarters, a gas flow pressure of up to 360 mbar can be approved if the appropriate conditions exist. The supplier must safeguard the gas flow pressure such that it cannot exceed the MOP of the burner's gas valve train.

High-pressure valve trains are normally used for gas flow pressures greater than 300 mbar. The supplier must safeguard the gas flow pressure such that, in the event of failure, it cannot exceed the maximum incidental pressure (MIP*) of the burner's gas valve train.

* MIP = MOP x 1.1

Gas / dual-fuel burner capacity graphs

The capacities as a function of combustion chamber pressure are maximum values measured in accordance with EN 676 on idealised flame tubes.

The burner capacity graphs are certified in accordance with EN 676. The stated ratings are based on an air temperature of 20 °C and an installation at sea level. For installations at higher altitudes, a reduction in capacity of 1 % per 100 m above sea level should be taken into account.

The combustion chamber pressure of the heat generator must be added to the flow pressure determined from the chart when sizing the gas valve train. Minimum flow pressure 15 mbar.

The LHV is referenced to 0 °C and 1013 mbar atmospheric pressure. All pressures are in mbar.

The LPG charts are based on propane, but may also be used for butane.

Oil burner capacity graphs

The capacities as a function of combustion chamber pressure are maximum values measured in accordance with EN 267 on idealised flame tubes.

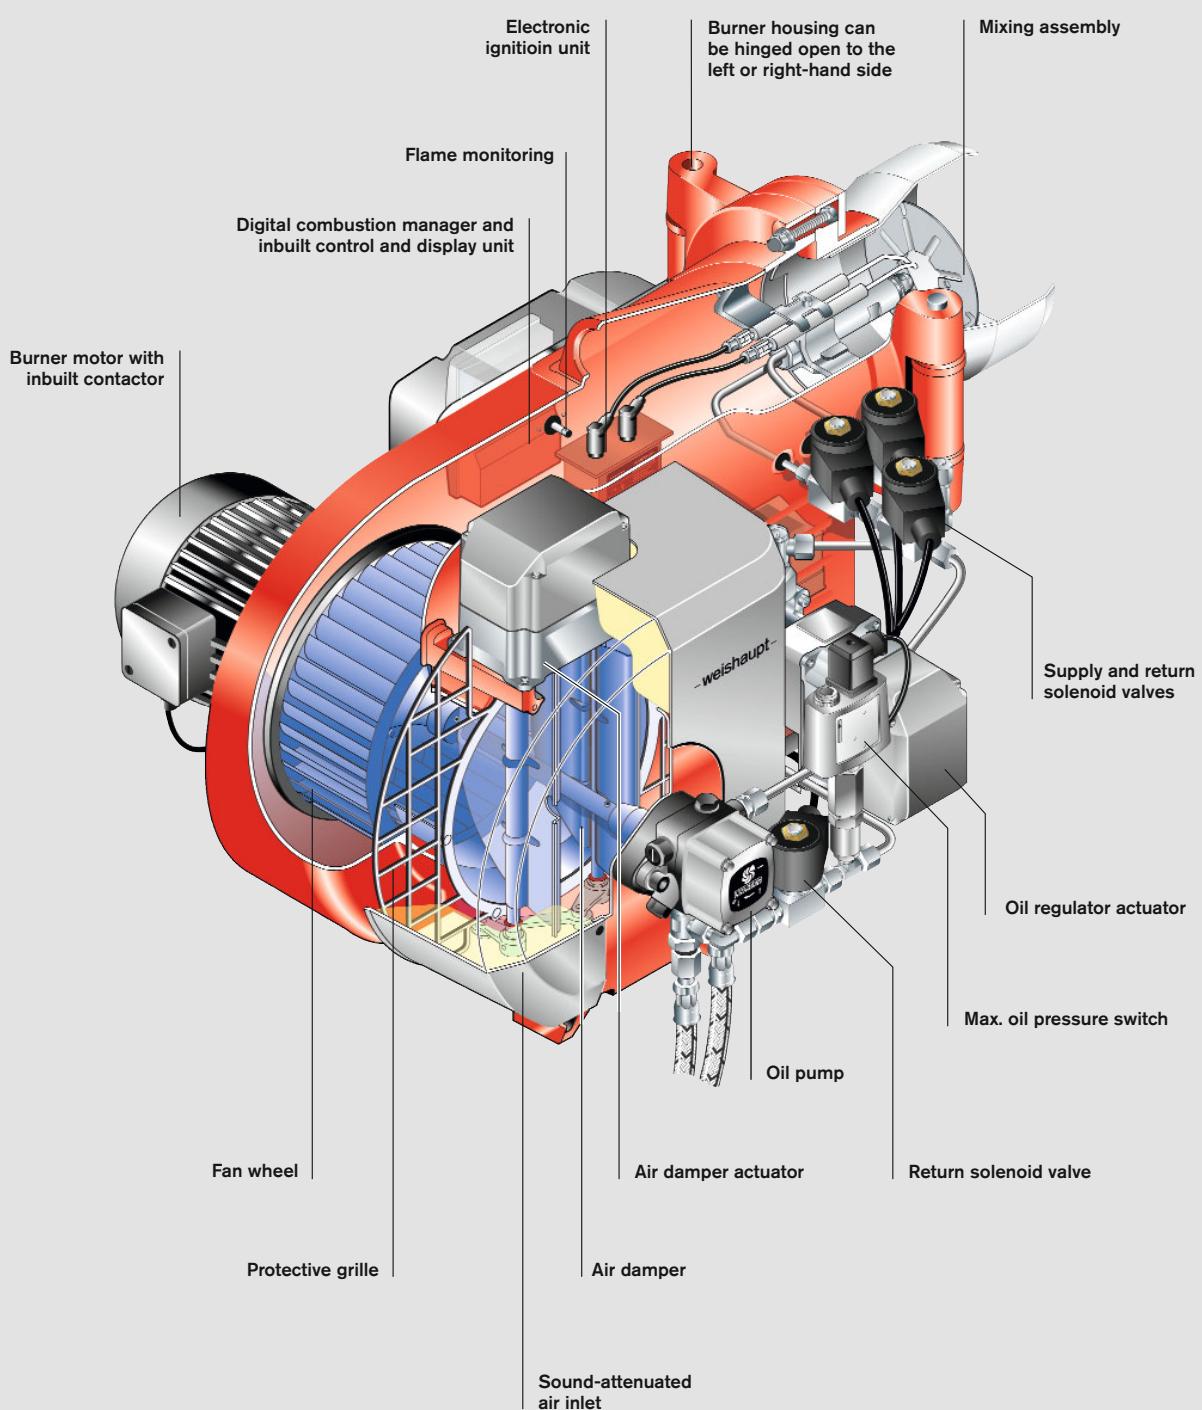

The burner capacity graphs are certified in accordance with EN 267. The stated ratings are based on an air temperature of 20 °C and an installation altitude of 500 m above sea level. For installations at higher altitudes, a reduction in capacity of 1 % per 100 m above sea level should be taken into account.

Stated oil throughputs are for gas oil with a LHV of 11.9 kWh/kg.

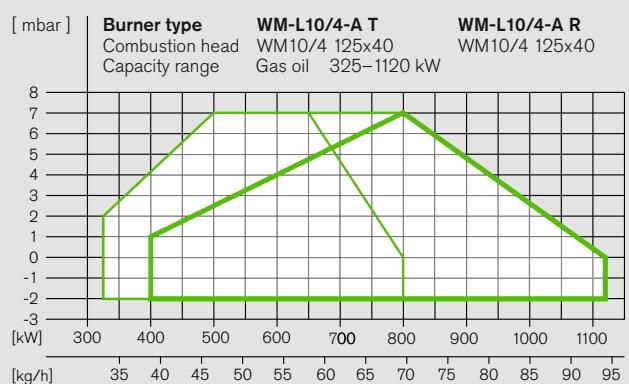

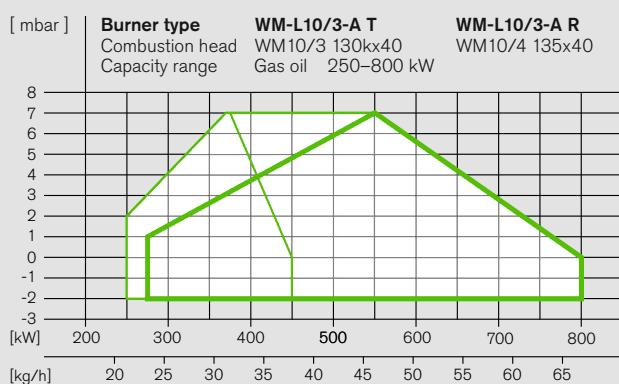

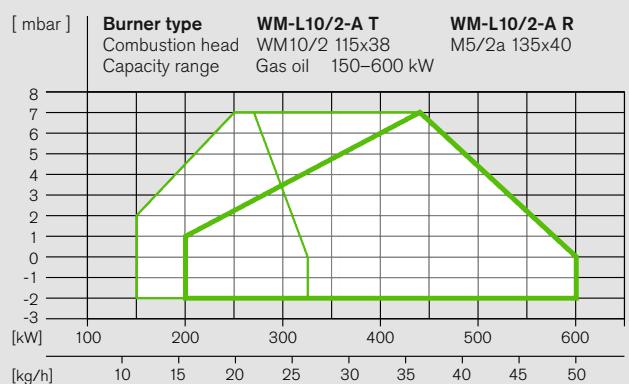

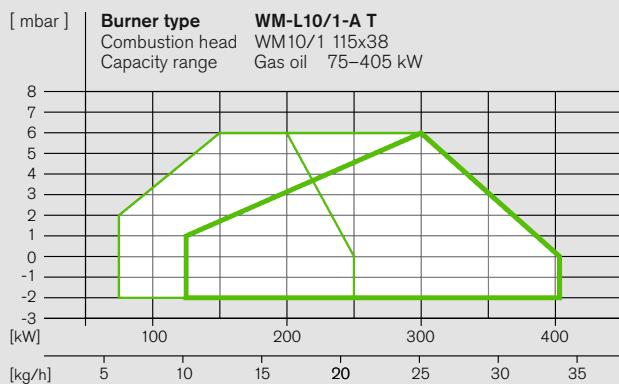

DIN CERTCO certification

The burners have been type-tested by an independent body (TÜV-Süd) and certified by DIN CERTCO.

IP 54 protection	●	●	●	●	●

EN 676 stipulates that ball valves, gas filters, and gas pressure regulators form part of the burner supply (see Weishaupt accessories list). Gas valve train handing should be confirmed at the time of order.

If not otherwise specified, the burner will be supplied configured for a right-handed gas valve train.

The burner can be altered for the opposite gas valve train handing through rotation of the gas butterfly valve and actuator.

Please enquire or see the special equipment section of this brochure for further burner executions.

- Standard
- Optional

¹⁾ The necessary motor protection can be provided either by a motor protection switch (supplied and fitted into a panel by others), or with integral motor overload protection (see special equipment).

²⁾ The WM-G10/4-A ZM-LN is equipped with VSD as standard (55 Hz motor)

Fuel systems

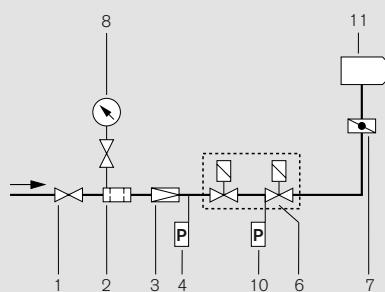

Gas side fuel system

W-FM 50 / 100 / 200

- 1 Ball valve *
- 2 Gas filter *
- 3 Pressure regulator, (LP) or (HP) *
- 4 High gas pressure switch *
- 5 Low gas pressure switch
- 6 Double gas valve assembly
- 7 Gas butterfly valve
- 8 Pressure gauge with push-button valve *
- 9 Valve-proving pressure switch
- 10 Low gas/valve-proving pressure switch
- 11 Burner

W-FM 54

* Not included in burner price

Mounting position of the high gas pressure switch:

- On the regulator outlet of HP trains
- After the regulator of screwed LP trains
- On the valve assembly inlet of flanged LP trains

Cable length approx. 2.5 m.

Layout of the gas valve train

On boilers with hinged doors, the gas valve train must be mounted on the opposite side to the boiler-door hinges.

Compensator

To enable a tension-free mounting of the gas valve train, the fitting of a compensator is strongly recommended.

Break points in the gas valve train

Break points in the gas valve train should be provided to enable the door of the heat generator to be swung open. It is best to separate the main gas line at the compensator.

Support of the gas valve train

The gas valve train should be properly supported in accordance with the site conditions. Please see the Weishaupt accessories list for various gas valve train support components.

Gas meter

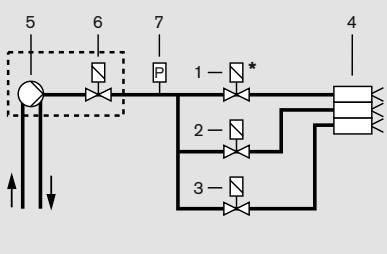

A gas meter must be installed to measure gas consumption during commissioning and servicing.

Optional thermal shutoff (if required by local regulations)

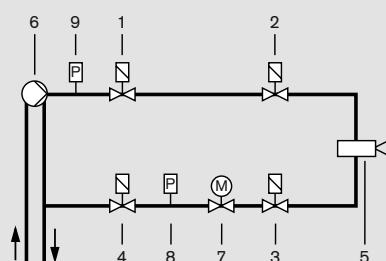

The thermal shutoff is integrated into the ball valve of screwed gas valve trains. On flanged gas valve trains the thermal shutoff is a separate component with HTB seals, and is fitted before the ball valve.

Oil side fuel system

Version

Version (ZM-)R

- 1 Stage 1 solenoid valve
- 2 Stage 2 solenoid valve
- 3 Stage 3 solenoid valve
- 4 Nozzle head with 3 oil atomising nozzles
- 5 Burner-mounted oil pump
- 6 Separate safety solenoid valve – WM-GL10/4 only
- 7 Pressure switch in supply (optional)
- * Standard on dual-fuel burners, optional on single-fuel oil burners

- 1 Normally closed solenoid valve
1st shut-off device in supply
- 2 Normally closed solenoid valve
2nd shut-off device in supply
- 3 Normally closed solenoid valve
1st shut-off device in return
- 4 Normally closed solenoid valve
2nd shut-off device in return
- 5 Nozzle head with regulating nozzle
- 6 Burner-mounted oil pump
- 7 Oil regulator
- 8 Pressure switch in return
- 9 Pressure switch in supply (optional)

ZMI-version Weishaupt monarch® burners

More power in compact form

The ZMI version of the Weishaupt WM-G10 monarch® burner was developed especially with industrial applications in mind. This burner, with its large turndown range, is designed for use on process plant.

The burner can achieve a turndown of up to 15:1 and its output is matched – within its operating range – to current heat demand.

Zero governor

The ZMI-version WM-G10 gas burner is additionally equipped with a zero governor, which is connected to the burner's airflow upstream of the fan by a flexible impulse line. The zero governor compensates for the drop in gas pressure between partial and full load.

Notes on operation

ZMI-version burners are only suitable for use on process plant when the following fundamental conditions are met:

- The flame must not be impeded within the combustion chamber by process-specific flue gas circulation or by secondary air.
- There must be a flue gas sampling point available prior to dilution by any other sources.
- A flame viewing port must be available.
- A gas flow meter / throughput indicator is essential for setting the burner.
- Additional requirements can be found on datasheet 8-1 in the Weishaupt technical folder.

Use

Fuels

Natural gas
LPG

The suitability of fuels of differing quality must be confirmed in advance with Weishaupt.

Applications

Weishaupt ZMI-version WM-G10 burners are suitable for intermittent firing and continuous firing on:

- EN 303-compliant heat generators
- LTHW boilers
- HTHW boilers
- Steam boilers
- Air heaters
- Process applications

Type approval

The ZMI version of the Weishaupt WM-G10 burner is not type approved. The burner's safety equipment meets the requirements of EN 676.

If an approval inspection is required, this should be arranged with the appropriate body by the plant operator.

Permissible ambient conditions

- Ambient temperature
-15 to +40 °C for gas firing
- Maximum 80 % relative humidity, no condensation
- The combustion air must be free of aggressive substances (halogens, chlorides, fluorides etc.) and impurities (dust, debris, vapours, etc.)
- Adequate ventilation is required for operation in enclosed spaces
- For plant in unheated areas, certain further measures may be required

Use of the burner for other applications or in ambient conditions not detailed above is not permitted without the prior written agreement of Max Weishaupt GmbH. Burner service intervals will be

reduced to accord with the more extreme operational conditions.

Protection Class

IP 54

Gas supply

EN 88-compliant regulators with safety diaphragms are used for low-pressure supplies.

For high-pressure supplies, an EN 334-compliant high-pressure regulator should be selected from the following technical booklets:

- Regulators up to 4 bar, Print No. 83001202
- Regulators with safety devices, Print No. 83197902

Refer to the burner's rating plate for the maximum connection pressure.

Gas valve train design

Low-pressure valve trains are normally used for gas flow pressures up to a maximum of 300 mbar and a maximum operating pressure (MOP) of 500 mbar. This allows for pressure losses between the transfer station and the valve train. Furthermore, it is assumed that the transfer station utilises components (SSV, regulator) that are not of the highest class of accuracy. In individual cases, following consideration and approval by Weishaupt's headquarters, a gas flow pressure of up to 360 mbar can be approved if the appropriate conditions exist.

The supplier must safeguard the gas flow pressure such that it cannot exceed the MOP of the burner's gas valve train.

High-pressure valve trains are normally used for gas flow pressures greater than 300 mbar.

The supplier must safeguard the gas flow pressure such that, in the event of failure, it cannot exceed the maximum incidental pressure (MIP*) of the burner's gas valve train.

*MIP = MOP x 1.1

Standards compliance

The burners are tested by an independent body and fulfil the applicable requirements of the following European Union directives and applied standards:

EMC EMC Directive
2014/30/EU

Applied standards

- EN 61000-6-1 : 2007
- EN 61000-6-2 : 2005
- EN 61000-6-4 : 2007

LVD Low-Voltage Directive
2014/35/EU

Applied standards

- EN 60335-1 : 2010
- EN 60335-2-102 : 2010

MD Machinery Directive
2006/42/EC

Applied standards

- EN 267 Annex J,
- EN 676 Annex J,

PED¹⁾ Pressure Equipment Directive
2014/68/EU

Applied standards

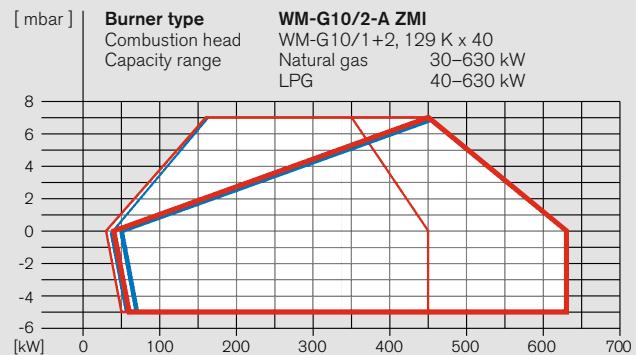

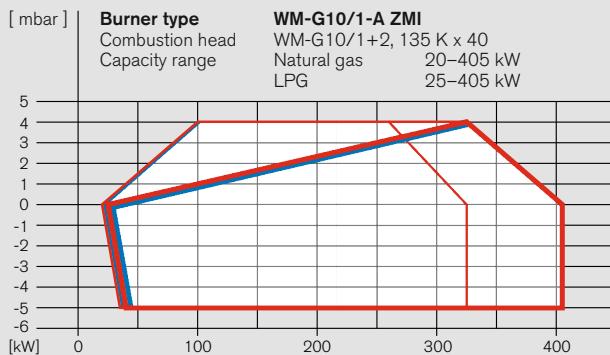

- EN 267 Annex K,
- EN 676 Annex K,
- Conformity assessment procedure: Module B

¹⁾ With the selection of appropriate equipment.

The burners are labelled with:

- CE Mark

Scope of delivery

Order numbers

Description	WM-G10 ZMI
Burner housing, hinged flange, housing cover, Weishaupt burner motor, air inlet housing, fan wheel, combustion head, ignition unit, ignition cable, ignition electrodes, combustion manager with control unit, flame sensor, actuators, flange gasket, limit switch on hinged flange, fixing screws	●
Digital combustion manager	
W-FM50	●
W-FM100	○
W-FM200	○
Valve proving via pressure switch and W-FM	●
Class-A double gas valve assembly	●
Gas butterfly valve	●
Air pressure switch	●
Low gas pressure switch	●
Preset, capacity-based mixing assembly	●
Actuators for compound regulation of fuel and air via W-FM:	
Air damper actuator	●
Gas butterfly valve actuator	●
DOL motor contactor fitted to motor ¹⁾	●
IP 54 protection	●

EN 676 stipulates that ball valves, gas filters, and gas pressure regulators form part of the burner supply (see Weishaupt accessories list).
 Gas valve train handing should be confirmed at the time of order.
 If not otherwise specified, the burner will be supplied configured for a right-handed gas valve train.
 The burner can be altered for the opposite gas valve train handing through rotation of the gas butterfly valve and actuator.

Please enquire or see the special equipment section of this brochure for further burner executions.

- Standard
- Optional

¹⁾ The necessary motor protection can be provided either by a motor protection switch (supplied and fitted into a panel by others), or with integral motor overload protection (see special equipment).

¹⁾ The necessary motor protection can be provided either by a motor protection switch (supplied and fitted into a panel by others), or with integral motor overload protection (see special equipment).

²⁾ The necessary motor protection can be provided either by a motor protection switch or with motor prefusing (supplied and fitted into a panel by others).

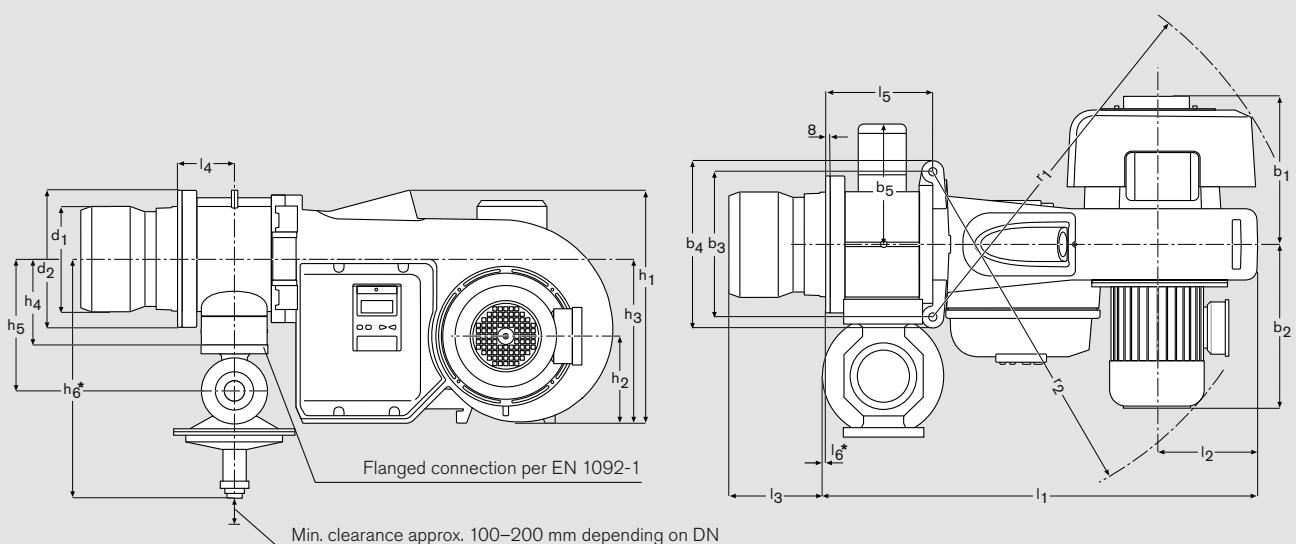

Voltages and frequencies:

The burners are equipped as standard for three-phase alternating current, 400 V, 3 ~, 50 Hz. Other voltages and frequencies are available on application.

Standard burner motor:

Insulation Class F, IP 55 protection.
IE3 Premium Efficiency.

All dimensions are approximate. Weishaupt reserve the right to make changes in light of future developments

* If the protrusion of the zero governor may foul the appliance mounting plate, then a spacer ring must be interposed between the plate and the burner flange (see accessories list). It should be noted that combustion head dimension l3 is thereby reduced by the depth of the spacer ring.

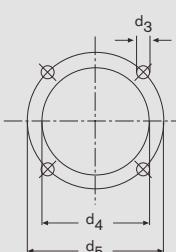

Heat generator preparation

- ① Flange gasket
- ② Refractory
- ③ Aperture

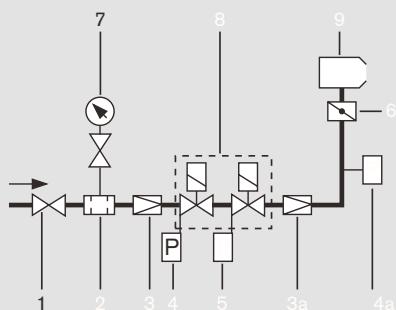

The refractory ② must not protrude beyond the front edge of the combustion head. It may however be tapered (min. 60°).

 - 8 Double gas valve assembly
 - 9 Burner
- * Not included in burner price

Layout of the valve train

On boilers with hinged doors, the valve train must be mounted on the opposite side to the boiler-door hinges.

Compensator

To enable a tension free mounting of the valve train, the fitting of a compensator is strongly recommended.

Break points in the valve train

Break points in the valve train should be provided to enable the door of the heat generator to be swung open. The main gas line is best separated at the compensator.

Support of the valve train

The valve train should be properly supported in accordance with the site conditions. Please refer to the Weishaupt accessories list for various valve train support components.

Gas meter

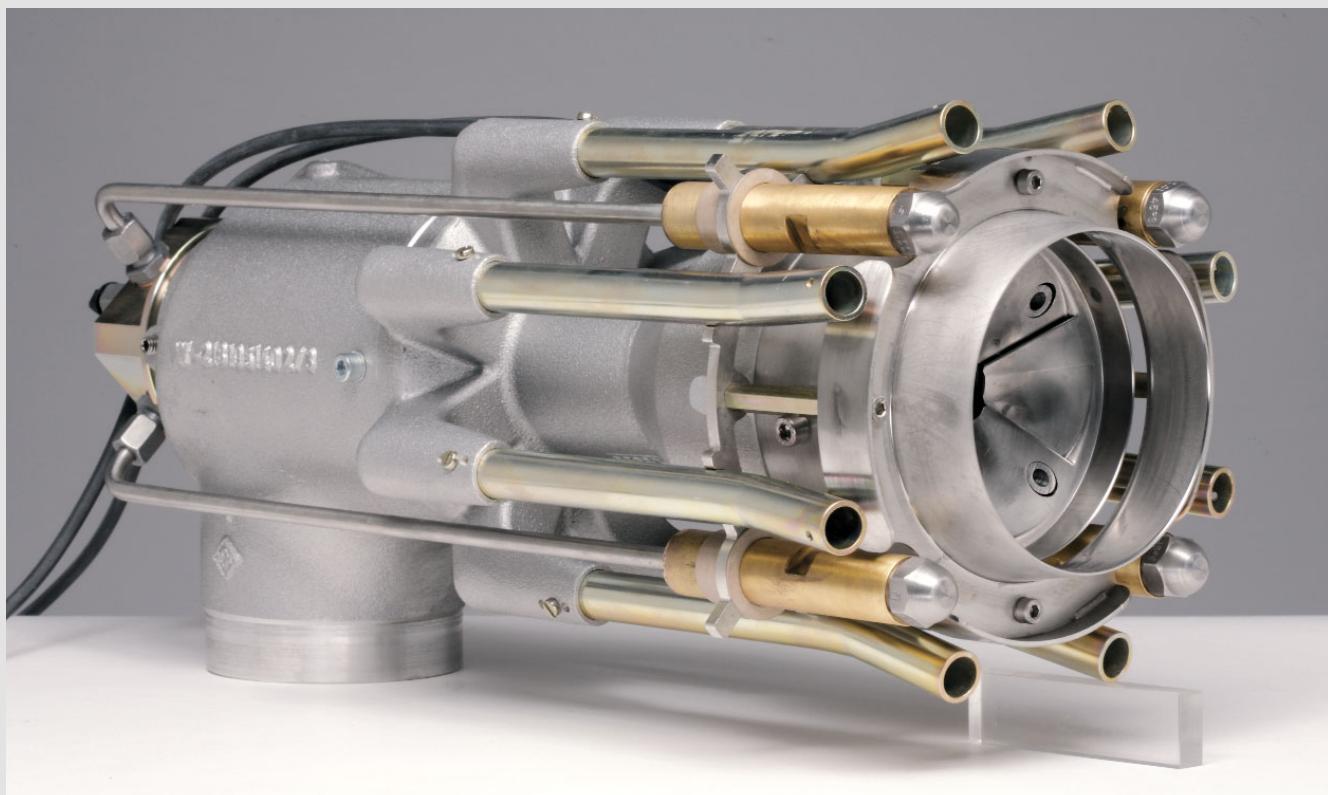

A gas meter must be installed to measure gas consumption during commissioning and servicing.

Optional thermal shutoff

(when required by local regulations)

Integrated into the ball valve of screwed valve trains. A separate component with HTB seals fitted before the ball valve on flanged valve trains.

Saving fuel, reducing emissions: Patented multiflam® technology

Weishaupt's patented multiflam® technology enables large combustion plant to meet very low emission limits without the need for expensive additional equipment. This reduction in emissions is achieved by using an innovative mixing assembly and fuel distribution system.

Weishaupt multiflam® burners have been proving themselves in the field for 20 years.

The latest monarch® burners bring this technology to medium-capacity ranges, combining flexibility with extremely low emissions.

Flexibility

Gas, oil, and dual-fuel versions of the mixing assembly have been developed. Gas-fired burners have modulating load control, while load control on oil-fired burners is multi-staged.

Exemplary emissions

The NO_x emissions produced by a 3LN-version multiflam® mixing assembly will be considerably lower than those of a standard-version mixing assembly under the same operating conditions. Key is the distribution of fuel among several nozzles and, consequently, its combustion in a primary and a secondary flame. This avoids extremely hot zones in the flame's core which, in turn, greatly reduces the formation of thermal NO_x.

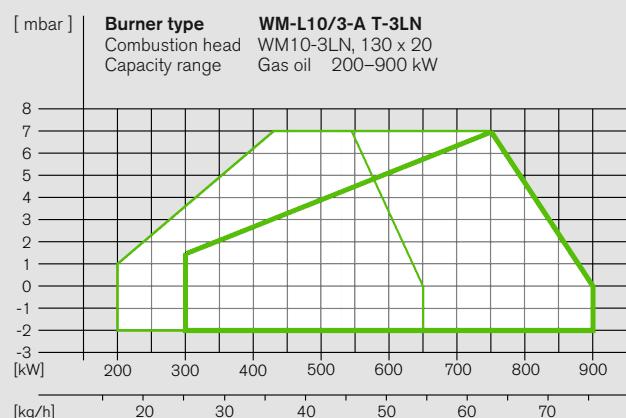

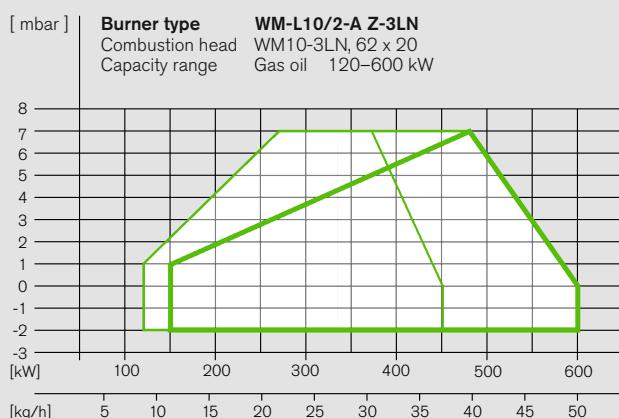

However, the achievement of good combustion figures depends on more than just the burner. Numerous additional parameters, such as the design of the heat generator, and the geometry and the thermal loading of its combustion chamber, are also important. Furthermore, medium temperature, combustion air temperature, and air humidity play a decisive role. When NO_x emissions for a particular application are guaranteed, it will always be with reference to certain constraints and system parameters.

Use

See page 14.

Please refer to page 15 for notes on the gas supply.

The LHV is referenced to 0 °C and 1013 mbar atmospheric. All pressures are in mbar.

Scope of delivery

Description	WM-L10 3LN	WM-G10 3LN	WM-GL10 3LN
Burner housing, hinged flange, housing cover, Weishaupt burner motor, air inlet housing, fan wheel, combustion head, ignition unit, ignition cable, ignition electrodes, combustion manager with control unit, flame sensor, actuators, flange gasket, limit switch on hinged flange, fixing screws	●	●	●
Digital combustion manager W-FM50 W-FM54	● -	● -	- ●
Valve proving via pressure switch and W-FM	-	●	●
Class-A double gas valve assembly	-	●	●
Gas butterfly valve	-	●	●
Air pressure switch	○	●	●
Low gas pressure switch	-	●	●
Preset, capacity-based mixing assembly	●	●	●
Actuators for compound regulation of fuel and air via W-FM:			
Air damper actuator	●	●	●
Gas butterfly valve actuator	-	●	●
Oil pump fitted to burner	●	-	●
Oil hoses	●	-	●
2 (Z-3LN)/3 (T-3LN) oil solenoid valves, nozzle head with pre-installed oil nozzles, 1 additional oil safety solenoid valve	●	-	●
DOL motor contactor fitted to motor ¹⁾	●	●	●
IP 54 protection	●	●	●
Electromagnetic clutch	○	-	○

EN 676 stipulates that ball valves, gas filters, and gas pressure regulators form part of the burner supply (see Weishaupt accessories list).
Gas valve train handing should be confirmed at the time of order.

If not otherwise specified, the burner will be supplied configured for a right-handed gas valve train.

The burner can be altered for the opposite gas valve train handing through rotation of the gas butterfly valve and actuator.

Please enquire or see the special equipment section of this brochure for further burner executions.

- Standard
- Optional

¹⁾ The necessary motor protection can be provided either by a motor protection switch (supplied and fitted into a panel by others), or with integral motor overload protection (see special equipment).

Technical data WM-L10, version 3LN (multiflam®)

Oil burners		WM-L10/2-A Z-3LN	WM-L10/3-A T-3LN
Burner motor	Weishaupt type	WM-D 90/90-2/1K0	WM-D 90/110-2/1K5
Motor power output	kW	0.9	1.5
Nominal current	A	2.2	3.2
Burner without VSD			
Motor protection switch ¹⁾ or motor prefusing ¹⁾ (with overload protection)	type (e.g.) A minimum	PKE12/XTU - 4 10 A gG/T (by others)	PKE12/XTU - 4 16 A gG/T (by others)
Burner with VSD			
Motor protection switch ²⁾ or motor prefusing ²⁾	type (e.g.) A minimum	PKE12/XTU - 4 10 A gG/T (by others)	PPKE12/XTU - 12 10 A gG/T (by others)
Speed (50 Hz)	rpm	2900	2900
Combustion manager	type	W-FM50	W-FM50
Flame monitoring	type	QRA2	QRA2
Integral pump max. flow rate	type l/h	AL 75C 130	AL 95C 150
NOx Class per EN 267		3	3
Oil hoses	DN / length	8 / 1000	8 / 1000
Mass	kg	approx. 65	approx. 68

¹⁾ The necessary motor protection can be provided either by a motor protection switch (supplied and fitted into a panel by others), or with integral motor overload protection (see special equipment).

²⁾ The necessary motor protection can be provided either by a motor protection switch or with motor prefusing (supplied and fitted into a panel by others).

Voltages and frequencies:

The burners are equipped as standard for three-phase alternating current, 400 V, 3 ~, 50 Hz. Other voltages and frequencies are available on application.

Standard burner motor:

Insulation Class F, IP 55 protection.
IE3 Premium Efficiency.

multiflam® dual-fuel burners, version 3LN

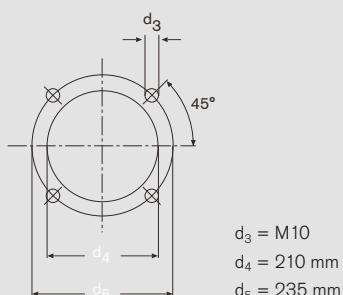

Burner type	Dimensions in mm															
	l_1	l_2	l_3	l_4	b_1	b_2	h_1	h_2	h_3	h_4	h_6	r_1	r_2	d_1	d_2	d_6
WM-GL10/2 ZM-Z-3LN	833	205	209–219	108	323	307	445	167	313	161	470	718	682	180	199	DN50
WM-GL10/3 ZM-T-3LN	833	205	212–222	108	323	335	445	167	313	161	470	718	698	180	199	DN50

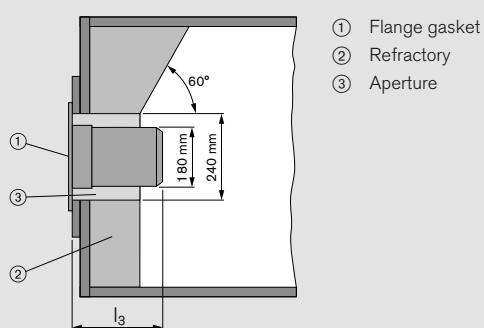

① Excluding electromagnetic clutch (pump with electromagnetic clutch: plus 130 mm)

② Projection of frequency convertor approx. 20 mm

Mounting-plate drilling dimensions

Heat generator preparation

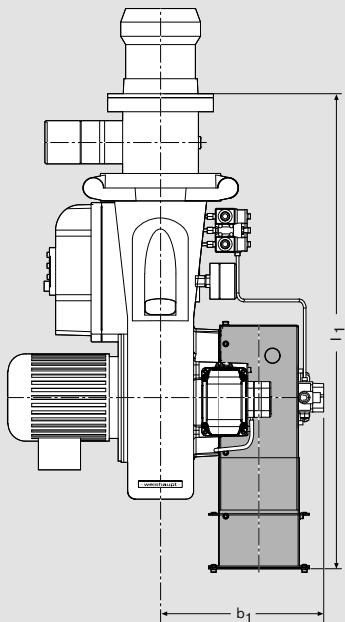

The leading edge of the combustion head must protrude approx. 50 mm beyond the refractory ②. The refractory may be tapered (min. 60°).

All dimensions are approximate. Weishaupt reserve the right to make changes in light of future developments.

Dimensions of ducted-air connection

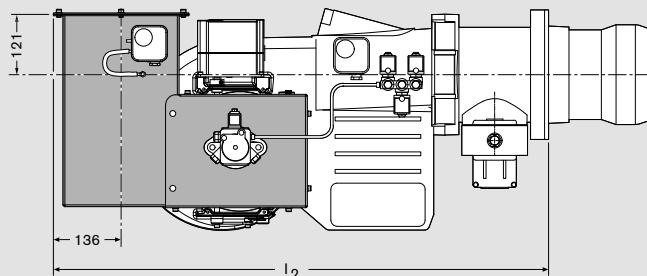

Gas, oil, and dual-fuel burners

Connection from rear

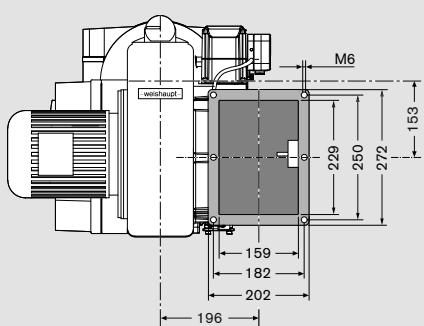

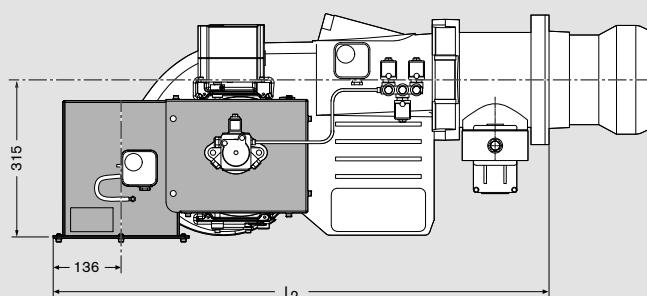

Dimension b₁ identical to standard air inlet housing

Connection from above

Connection from below

Inlet flange dimensions identical for all versions.

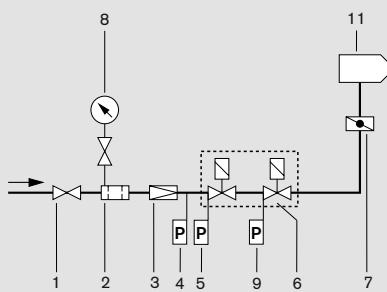

Burner type	Version	Dimensions in mm
		l ₁ l ₂
WM-L10/2 to 10/3	3LN	970 994
WM-L10/1 to 10/4		796 820
WM-G10/1	LN	930 954
WM-G(L)10/2	3LN	970 994
WM-G(L)10/1 to 10/2		950 974
WM-G(L)10/3 to 10/4		970 994

All dimensions are approximate.

Fuel systems

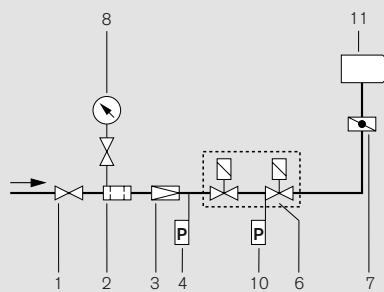

Gas-side fuel system

W-FM 50 / 100 / 200

- 1 Ball valve *
- 2 Gas filter *
- 3 Pressure regulator, (LP) or (HP) *
- 4 High gas pressure switch *
- 5 Low gas pressure switch
- 6 Double gas valve assembly
- 7 Gas butterfly valve
- 8 Pressure gauge with push-button valve *
- 9 Valve-proving pressure switch
- 10 Low gas/valve-proving pressure switch
- 11 Burner

W-FM 54

* Not included in burner price

Mounting position of the high gas pressure switch:

- On the regulator outlet of HP trains
- After the regulator of screwed LP trains
- On the valve assembly inlet of flanged LP trains

Cable length approx. 2.5 m.

Oil-side fuel system

WM-(G)L10/2-A (ZM-)Z-3LN:

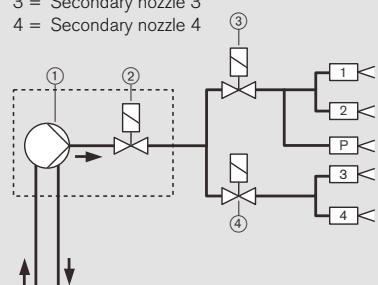

P = Primary nozzle

1 = Secondary nozzle 1

2 = Secondary nozzle 2

3 = Secondary nozzle 3

4 = Secondary nozzle 4

① Burner-mounted oil pump

② Oil pump solenoid valve

③ Ignition load / stage 1 solenoid valve
(three-nozzle ignition)

④ Stage 2 solenoid valve

WM-(G)L10/3-A (ZM-)T-3LN:

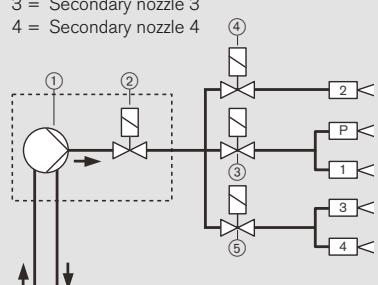

P = Primary nozzle

1 = Secondary nozzle 1

2 = Secondary nozzle 2

3 = Secondary nozzle 3

4 = Secondary nozzle 4

① Burner-mounted oil pump

② Oil pump solenoid valve

③ Ignition load solenoid valve
(two-nozzle ignition)

④ Stage 1 solenoid valve

⑤ Stage 2 solenoid valve

Layout of the valve train

On boilers with hinged doors, the valve train must be mounted on the opposite side to the boiler-door hinges.

Compensator

To enable a tension free mounting of the valve train, the fitting of a compensator is strongly recommended.

Break points in the valve train

Break points in the valve train should be provided to enable the door of the heat generator to be swung open. The main gas line is best separated at the compensator.

Support of the valve train

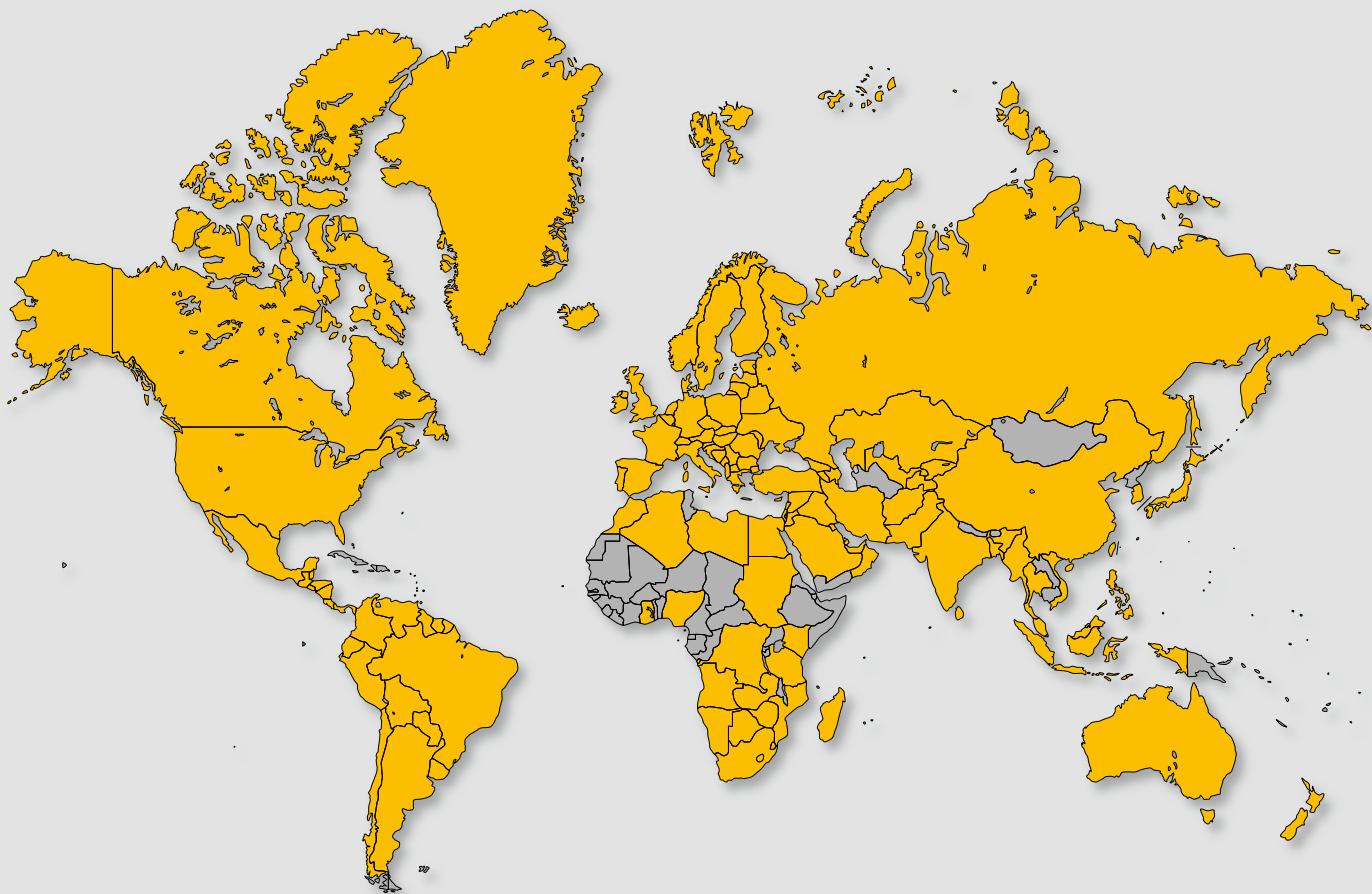

The valve train should be properly supported in accordance with the site conditions. Please refer to the Weishaupt accessories list for various valve train support components.

Gas meter

A gas meter must be installed to measure gas consumption during commissioning and servicing.

Optional thermal shutoff (when required by local regulations)

Integrated into the ball valve of screwed valve trains. A separate component with HTB seals fitted before the ball valve on flanged valve trains.
